Package 'ClockstaR2'

March 25, 2014

Type Package		
Title ClockstaR: choosing the number of relaxed-clock models in molecular phylogenetic analysis		
Version 2.0		
Date 2014-03-21		
Author Sebastian Duchene		
Maintainer Sebastian Duchene <sebastian.duchene@sydney.edu.au></sebastian.duchene@sydney.edu.au>		
Description Relaxed molecular clocks allow the phylogenetic estimation of evolutionary timescales even when substitution rates vary among branches. In analyses of large multigene datasets, it is often appropriate to use multiple relaxed-clock models to accommodate differing patterns of rate variation among genes. We present ClockstaR, a method for selecting the number of relaxed clocks for multigene datasets.		
Depends R (>= 2.15.0), ape (>= 3.0-8), cluster (>= 1.14.4)		
Suggests phangorn (>= 1.7-4), doParallel (>= 1.0.3), foreach(>= 1.4.1)		
License GNU

2 ClockstaR2-package

ClockstaR2-package ClockstaR: choosing the number of relaxed-clock models in molecular phylogenetic analysis

Description

Relaxed molecular clocks allow the phylogenetic estimation of evolutionary timescales even when substitution rates vary among branches. In analyses of large multigene datasets, it is often appropriate to use multiple relaxed-clock models to accommodate differing patterns of rate variation among genes. We present ClockstaR, a method for selecting the number of relaxed clocks for multigene datasets.

bsd.dist

Estimate sBSDmin distnace between a pair of trees

Description

This function estimates the sBSDmin distance between a pair of trees. This distance metric is described in the original publication. See reference bellow.

Usage

```
bsd.dist(tree1, tree2)
```

Arguments

tree1 A phylogenetic tree of class 'phylo'. It should have branch lengths.
tree2 A phylogenetic tree of class 'phylo'. It should have branch lengths.

Details

See reference

Value

A numeric vector with the sBSDmin (min.bdi.scaled), the scaling factor (scaling.factor), and the unscaled BSD (min.bdi).

bsd.matrix

Estimate the sBSDmin distance for all pairs of trees in a list

Description

bsd.matrix estimates the sBSDmin distance for all paris of trees in a list. It returns an object of class bsd with the pairswise distances and the scaling factors. The scaling factors represent the differences in the magnitude of the rates among trees. See the help file for bsd.dist for more details.

Usage

```
bsd.matrix(tree.list)
```

Arguments

tree.list

A list of trees. It can be a list where each item is a tree, or an object of class multiPhylo. The trees can have names. See the example bellow.

Value

An object of class 'bsd', which is a list with

comp1 An object of class dist with the pairwise distances for trees comp2 An object of class matrix with the scaling factors among trees

bsd.matrix.para

Estimate the sBSDmin distance for all pairs of trees in a list with parallelisation.

Description

bsd.matrix estimates the sBSDmin distance for all paris of trees in a list. It returns an object of class bsd with the pairswise distances and the scaling factors. The scaling factors represent the differences in the magnitude of the rates among trees. See the help file for bsd.dist for more details.

Usage

```
bsd.matrix.para(tree.list, para = F, ncore = 1)
```

Arguments

tree.list A list of trees. It can be a list where each item is a tree, or an object of class

multiPhylo. The trees can have names. See the example bellow.

para logical. select T to run in parallel.
ncore number of cores for parallelisation.

Value

An object of class 'bsd', which is a list with

comp1 An object of class dist with the pairwise distances for trees

comp2 An object of class matrix with the scaling factors among trees

10 clockstar.interactive

clockstar.interactive Run clockstar interactively

Description

This function can be used to run ClockstaR interactively. It prompts the use for a file with the gene trees in NEWICK format and some options for the clustering methods.

Usage

```
clockstar.interactive()
```

Author(s)

Sebastian Duchene

References

optim.trees.interactive

Optimise the branch lengths of gene trees interactively

Description

optim.tree.interactive can be used to optimise the gene trees interactively. The data should be a folder with the alignment for each data subset (or gene) and a tree topology. The alignments should be in FASTA format and the tree should be in NEWICK. Please see the example data set.

Usage

```
optim.trees.interactive()
```

Details

The function does not take any arguments. When it is called, it prompts the user for the folder with the data and the substitution models for each data set.

Author(s)

Sebastian Duchene

```
## Not run:
optim.trees.interactive() # Follow the instructions in the prompt
## End(Not run)
```

partitions 13

partitions

function partitions applied to objects of class bsd

Description

This is the definition of method partitions for bsd objects. See partitions.bsd for more details.

Usage

```
partitions(bsd.object, ...)
```

Arguments

bsd.object

An object of class bsd, obtained with bsd.matrix or bsd.matrix.para

Author(s)

Sebastian Duchene

partitions.bsd

Obtain optimal partitioning scheme

Description

This function obtains the optimal number of partitions for gene trees. The input should be an object of class 'bsd' with the pairwise distances among tres and the scaling factors (see bsd.matrix for more details on this class). partitions.bsd returns an object of class partitions with a matrix with the parition assignments, the range of the sBSDmin distances and an object of class cluster with the output from the clustering analysis.

Usage

```
partitions.bsd(bsd.object, FUN = pam, find.best = T, B = 500, gap.best = "firstSEmax", kmax = "'
```

Arguments

bsd.object	An object of class bsd. It can be obtained with bsd.matrix or bsd.matrix.para. The example(bsd.matrix) for details.
FUN	A clustering function as defined in the package cluster. It can be pam, clara, or fanny. However note that for fanny the maximum k should be the number of data subsets / 2.
find.best	logical. Select T to find the optimal number of partitions. If F, the function does not find the best number of partitions.
В	Numeric. Number of bootstrap replicates for the Gap statistic. Not used if find.best $== F$
gap.best	A character. The criterion to select the optimal number of partitions (k). It can be any of "firstSEmax", "Tibs2001SEmax", "globalSEmax", "firstmax", or "globalmax".
kmax	Numeric. Maximum number of partitions to test. The default is the number of data subsets - 1.
	Additional arguments passed to the clustering function.

partitions.bsd 15

Details

see the help for pacakge clustering for more details.

Value

An object of class 'partitions'

parts.mat A matrix with the cluster assignments. The partitions are numbered from 1:max-

imum k. The columns are each value of k, and the columns are the names of the

data subsets if provided.

range.bsd A numeric vector with the range of the sBSDmin distances

best.k The optimal number of partitions. Only returned if find.best == T

clusterdata Results from the Gap statistic. Only returned if find.best == T. See ?clusGap for

more details

plot.partitions

plot objects of class partitions

Description

This function plots the results from the gap statistic from package cluster, and a matrix with colours for the partition assignments.

Usage

```
plot.partitions(partitions.object, save.plot = F, file.name = "results_clockstar")
```

Arguments

partitions.object

An object of class 'partitions', obtained with partitions.bsd

save.plot logical. Select T to save the plots to a pdf file, or F to print in two new graphics

devices.

file.name A character. If save.plot == T, the name of the file to print the results.
